

Some semiconductors and custom IC's can be damaged by electrostatic discharge during handling. This notice explains how you can minimize the chances of destroying such devices by:

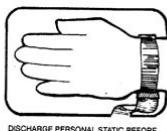

1. Knowing that there is a problem.
2. Learning the guidelines for handling them.
3. Using the procedures, and packaging and bench techniques that are recommended.

The Static Sensitive (S.S.) devices are identified in the Fluke technical manual parts list with the symbol

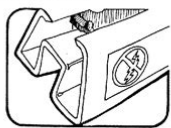

The following practices should be followed to minimize damage to S.S. devices.

1. MINIMIZE HANDLING

3. DISCHARGE PERSONAL STATIC BEFORE HANDLING DEVICES. USE A HIGH RESISTANCE GROUNDING WRIST STRAP.

2. KEEP PARTS IN ORIGINAL CONTAINERS UNTIL READY FOR USE.

4. HANDLE S.S. DEVICES BY THE BODY

Did you miss your activation email It starts to present noise on the demodulation of the signals. This noise makes the measurement of the deviation and AF signal impossible. As well, the scope is showing me noise instead of clear CTCSS or audio signals like 1000 HZ. Please give me some ideas how to solve this issue. Where to look Which module should I verify Where can I find component level manual for Power Supply.

<http://completedetailspainting.com/images/braun-activator-8585-manual.pdf>

Ive downloaded the component level manual from, but its missing the A9 Power Supply chapter. Thanks. It is an absolute PITA to work on, I know as I have repaired two of these supplies in the past, admittedly not with the amount of damage shown. Even with a schematic they would be very difficult to repair unless you have a lot of experience with SMPSUs and can easily be lethal as there is some 350VDC at high current used in them. George G6HIG They are basically a 120VAC design, I know some will argue this, and dont like operating on 230VAC. George G6HIG Wally KC9INK At this point the cost of a single item is almost 100% of the current value of the instrument. Spares for HP test sets are sometimes available from Israel, but again prices are high as are shipping charges. Incidentally the posting that you are replying to was made in 2018.If the main switching device is out, that could be replaced, but figuring out the control feedback is far more difficult. Would it be possible to use another PS Or several one for each voltage I do not know how many different volts are supplied. Wally In my opinion it would be virtually impossible to replace the 8920A power supply internally with anything else, it is a custom unit made to fit a very tight space. To remove it without damaging the plastic mains switch operating plastic rod means quite a lot of work. It is a particularly nasty design by todays standards. The problems are two fold, it uses a transformer to provide isolation in the feedback path, this means that a blow up around the switching stage can be transmitted back into the low voltage stage regulators, current designs mainly use opto isolators to prevent this. Secondly it is a flyback design which if it losses the feedback loop it will almost certainly totally self destruct, which appears to be the case with this one. For myself I would repair it, but I will not do so for anyone else as almost invariably they fail again in short order due to hidden damage.

<http://complexitycafe.com/images/braun-aromaster-classic-manual.pdf>

There is also the chance that the insulation within the main switching transformer has been compromised. In Europe there is some 370VDC, mains derived at low impedance around the switching stage, this can readily cause molten copper to be produced, also unless working in a safe environment using an isolation transformer there a severe Health and Safety issues. There are safe ways of working on these supplies, if you have been trained to do so and are experienced. My best regards to you. George.
