casio cpw-100 manual

In fact accuracy wise they are still holding their own against more modern offerings and they have the advantage of being within a much neater footprint, despite later sensor size reductions. This model appeared back in 1993 and one of the first Casio's to feature a compass sensor. The circular digital display is still rather novel, but it shows what you need to see very well. But as the entire model is just 12 mm thick and the lug to lug is very small by today's standards, so easily fits the smaller wrist. The Direction is also indicated at the top of the dial as NW, ENE, etc. here shown as WSW in place of the Day of the week. It does however have a "navigation" mode which allows you to store up to 5 sets of measurement data in memory, along with the date and time of the measurement. These can be recalled later to trace your progress on a map for example. To aid navigation the outer bezel can be rotated N mark to line up with indicated N for example. Circa 1993 In fact both models use their respective running Seconds track as the compass indication. Also there is a a daily Alarm mode and Time signal function etc. That said as the Declination where I live is just 1.3W and would be just 1W if entered into a modern Casio, so for general directional compass work, walking etc. Module wise both are perfect and function as new and they both "wear" well on the wrist and can often attract comment if noticed as they are both very neat, though at my age folks seem to take it for granted that I'll have old things! This is not surprising as within this "novelty" period, Casio whilst introducing individuality in their digital range, inevitably featured similar if not identical modules, to fit the various dial designs.
